

UNIVERSAL WATER TREATMENT & RECYCLING PROCESS FOR THE OIL AND GAS INDUSTRY.

Ecologic Solutions has developed a treatment process that allows drilling operators to treat and recycle frac flow & production water for reuse in their operations. Ecologic has a new innovative approach designed for extreme efficiency and to be a lower cost alternative for the operators. The system is customized and can process boundless amounts of waste water. Normal volumes treated can range from 1,000 bbl/day to over 100,000 bbl/day. Ecologic's process is powered by industrial Mitton Cavitation units. The units treat the waste water in its reactor removing hydrocarbons, metals, salts and various bacteria types present in oil & gas waste water. The ability to apply cavitation to flow back & production water using only a small amount of mechanical energy changes everything.

- Waste water is treated and recycled at a highly competitive rate
- Clean water will be made available to operators for reuse
- Has a smaller foot print than other industry options
- Heavily reduces truck traffic
- Expandable during growth
- Single unit recycling capacity of 80,000 bbl/day minimum
- Remote monitored & GPS tracking
- Our system is set up easily & ready to use in a short period of time
